

Emmanuel Akinroye

Senior Frontend Engineer

kinemcodes@gmail.com | +234 810 474 2511 | github.com/emma66886 | linkedin.com/in/emmanuelakinroye | Remote, based in Nigeria

SUMMARY

Senior frontend engineer with 7+ years of React and TypeScript in production. I build the parts of a product people sit in front of all day: real-time collaborative screens, scheduling and capacity views, payment flows and data-heavy dashboards. I know the backend well enough to design against it instead of around it, which is usually why teams bring me in. I test what matters with Jest. I work directly with founders on live codebases, fully remote across UK, EU and US time zones.

SKILLS

Frontend: React, Next.js, TypeScript, JavaScript, Redux, Context API, Tailwind CSS, responsive and cross browser UI, reusable component libraries

Real-time UI: WebSockets, multiplayer state sync, live dashboards, messaging and notifications, sub-50ms latency under sustained load

APIs and data: REST, GraphQL, OpenAPI and Swagger, webhooks, Stripe, Paystack, KYC and AML flows

Testing and quality: Jest, unit and integration tests, strict TypeScript, code review and release standards, GitHub Actions CI/CD, PostHog analytics

Backend when it helps: Node.js, NestJS, Express, PostgreSQL including row level security, Supabase, MongoDB, Redis, Docker, AWS (EC2, S3, RDS, Lambda)

Other languages: Python, Java, C#, Rust, SQL, Solidity

EXPERIENCE

Chief Technology Officer and Engineer, Usefleet

Mar 2026 to Present, Remote

- Own technical direction and lead engineering delivery, with the product surface and how it is built as my first concern.
- Set the frontend conventions the team works to: component boundaries, typing rules, Jest coverage and what has to pass before a release ships.
- Build and direct a small engineering team while staying hands-on in the day to day work.

Principal Engineer, Kinem Labs (BuildArena)

Jun 2025 to Jun 2026, Remote

- Built real-time multiplayer collaboration over WebSockets, keeping editor, canvas and output state in sync across people working in the same workspace.
- Delivered a live visualisation layer that redraws program structure and state relationships as users type.
- Owned the client architecture: workspace state, authenticated data fetching and the component patterns the rest of the app is built from.
- Kept the front end fast under constant updates, and shipped it through self hosted Docker infrastructure, GitHub Actions CI/CD and PostHog analytics.

Senior Frontend Engineer, Ridgeway, Texas, United States

Jan 2026 to Jun 2026, Contract, Remote

- Built the interface for an AI natural language to action system, turning what users typed into operations they could watch run.
- Built the payment screens, handling sensitive transaction flows carefully on the client and keeping confidential data out of places it should not be.
- Work shipped on this product processed over \$300,000 in transaction volume.
- Covered the critical flows with Jest so payment paths could not regress quietly, and shipped through GitHub Actions CI/CD on AWS.

Senior Frontend Engineer, Timglobal, UK (Healthcare SaaS)

Jul 2025 to Dec 2025, Contract, Remote

- Shipped features across a live multi-tenant healthcare platform used by care coordinators, field staff and providers.

- Built staff scheduling screens covering shift allocation, availability and capacity, giving operational leads a clear view of workload.
- Built real-time messaging and notification delivery that stayed responsive under sustained concurrent load.
- Implemented workflow steps for care task assignment, handover and approval, replacing manual coordination between provider teams.
- Built permission aware screens where what each role can see and do follows the access rules, over sensitive personal data under UK care sector requirements.

Senior Frontend Engineer and Tech Lead, Cryptrapay

Jul 2024 to Dec 2024, Contract, Remote

- Founding engineer on a payments and settlement platform built from nothing, owning the interface end to end.
- Built React and TypeScript screens for multi-currency wallets, merchant onboarding and live transaction state.
- Reconciliation work kept ledger state consistent across systems and cut payment failures by 35%.

Senior Frontend Engineer, Allark

Mar 2023 to Jun 2024, Contract, Remote

- Built a type safe React and TypeScript frontend for complex real-time workflows, cutting runtime errors by 70%.
- Built the WebSocket layer behind it, carrying 1,000+ concurrent sessions at sub-50ms latency in production.
- Sole engineer on the platform, from the first screen through to production.
- Held 99.9% availability with fault tolerance across every external integration the UI depended on.

Senior Frontend Engineer, Neatio

Jul 2022 to Jan 2023, Contract, Remote

- Delivered developer documentation and integration work that cut third party integration time by 60%.
- Built the services and integrations behind it with retry and recovery logic, so the client stayed reliable when upstream systems did not.

Senior Frontend Engineer and Tech Lead, Blockride

Sep 2021 to Aug 2022

- Led delivery of a marketplace platform in a startup team, owning the frontend architecture.
- Built the React and Next.js frontend for high volume marketplace transactions.
- Cut fraudulent transactions by 90% with multi-step verification workflows and atomic transaction logic.

EARLIER EXPERIENCE

Frontend Engineer, Bole (Apr 2020 to Feb 2021, Remote). React application with ethers.js integration for token swaps and liquidity management.

Frontend Developer, Remax Real Estate (MaltaHomeSearch), Malta (Jun 2019 to Mar 2020, Remote). React and Next.js property platform serving 1,000+ monthly active users against 15+ REST endpoints.

SELECTED WORK

BuildArena (buildarena.dev). Collaborative build platform. Editor, canvas and output stay in sync across everyone in a workspace, with a visualisation layer that redraws program structure as you type.

Cryptrapay (cryptrapay.com). Payments and settlement platform built from zero, with multi-currency wallet screens, merchant onboarding and live transaction state.

Hookroast (hookroast.com). Pre-send deliverability platform for cold email: spam scoring on drafts, recipient verification, domain reputation and SPF, DKIM and DMARC checks.

EDUCATION

CS50x: Introduction to Computer Science, Harvard University (edX)

Doctor of Veterinary Medicine (DVM), University of Ibadan, Nigeria, 2017 to 2024
